

Amphibious & Marine Transportation for Pig Runs & Cathodic Surveys

A successful tool run with accurate data for the pipeline owner is the goal of every supplier. However, if certain areas are missed, due to inaccessibility, this can lead to inaccurate anomaly position coordinates. **Texas Marine Inland Services, LLC** can help with these issues by providing access to almost all difficult areas of pipeline right-of-ways in the safest ways available.

Our U.S. Coast Guard licensed and trained Captains can get your crews and equipment into swamps, marshes, rivers, creeks and bays to Benchmark and set AGMs that are sometimes skipped over during a tool run compromising accuracy. Our experience with Latitude/Longitude

coordinates and GPS plotters helps to insure that accuracy. All amphibious vehicles and boats are equipped with GPS plotters and Google Earth to assist your crews in getting to those tough areas.

Safety is our biggest concern and with 38 years of pipeline integrity experience and amphibious marine experience we can help make your tool run successful. Our fleet consists of amphibious airboats, tracked amphibious vehicles, shallow draft work boats capable of transporting ATVs and UTVs, along with shallow draft response barges.

Let **TEXAS MARINE INLAND SERVICES** make your next tool run a success
